IMPLEMENT CLIENT SCRIPT & UI POLICY (INCIDENT)

Based only on the supplied project document

PROJECT JOURNEY MAP

	CONFIGURE		AUTOMATE			TEST & VER				
STEPS	**Create UI Policy**	**Urgency UI Action**	**onChange Script**	**onSubmit Script**	**onCellEdit Script**	**Test Mandatory**	**Test Successful Save**	**Reverse Condition**	**Test List Edit**	**Test Form Update**
WHAT HAPPENS	Create the High Impact Control UI Policy on the Incident table. Set Impact is 1 – High; Active = true; Reverse if false = true.	Add an action for Urgency. Set Read-only = true; leave Visible unchanged.	Create an active onChange Client Script on Incident; Field name: Impact. Set urgency to 1 when newValue is 1.	Create an active onSubmit Client Script. If Impact = 1 and Assigned To is empty, show an error and return false.	Create an active onCellEdit Client Script on Incident; Field name: State. Show alert and callback(false).	Set Impact to High, leave Assigned To empty, and click Submit. Verify the record is not saved and an error appears.	Fill Assigned To and click Submit. Verify the Incident saves without errors.	Change Impact from High to Medium. Verify Assigned To is no longer mandatory and Urgency becomes editable.	In Incident → All, try to edit State directly. Verify an alert appears and State remains unchanged.	Change State on the Incident form and click Update. Verify the change saves successfully.
INTERACTIONS / TOUCHPOINTS	System UI → UI Policies	UI Policy Actions related list	System UI → Client Scripts; Incident form	System UI → Client Scripts; save action	System UI → Client Scripts; Incident list	Incident → Create New	Incident form	Existing Incident form	Incident list view	Incident form
GOAL / MOTIVATION	Apply controls when Impact is High.	Make Urgency read-only for High impact.	Auto-set urgency for High impact.	Prevent saving when Assigned To is missing for High impact.	Block State changes through list editing.	Confirm mandatory enforcement.	Confirm successful save and other configured behaviors.	Confirm Reverse if false behavior.	Confirm list-edit blocking.	Confirm form-based State changes are allowed.
POSITIVE RESULT	Policy saved and active for Incident records.	Urgency remains visible but cannot be changed when condition is met.	Urgency updates automatically to High.	Missing Assigned To blocks the save and displays an error.	List edit is blocked with an alert.	Incident is not saved; error identifies Assigned To.	Incident saves without errors.	Assigned To is not mandatory; Urgency is editable.	State stays unchanged after list edit attempt.	State change saves successfully from the form.
CHECK / WATCH FOR	Condition must be Impact = 1 – High.	Visible setting is left unchanged.	Script returns for loading or empty newValue.	Validation applies when Impact is High and Assigned To is empty.	Script monitors the State field.	Confirm UI Policy and urgency behavior too.	Check urgency, read-only, and State restrictions.	Save the record after changing Impact to Medium.	Do not change State through list editing.	Other fields must still follow configured rules.
